## Biodermis Epi-Derm Silicone Gel Sheeting

### Biodermis Silicone Scar Management Product Range

#### Biodermis Epi-Derm Silicone Gel Sheeting

Epi-derm® is a soft silicone gel sheet for treating keloid and hypertrophic scars. Silicone sheets are tacky on the back and easy to apply. Epi-derm silicone gel sheeting is the most effective, proven method of scar management available today.

#### How Does Silicone Work?

Scars need an ideal healing environment, meaning the appropriate balance of moisture and maximum exposure to oxygen. Silicone fully encapsulates the scar site, meaning that it completely covers the treatment site for even distribution of necessary moisture (hydration), and maximum exposure to oxygen. Although the entire site is covered, silicone is semipermeable, allowing oxygen to enter while keeping excess moisture out. Properly hydrated and oxygenated skin allows surrounding healthy tissue to better blend with scar tissue, resulting in a scar that is more natural in color, softer and flatter overall. Use as directed can dramatically reduce the appearance of scars.

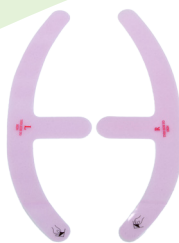

#### Epi-Derm C-Strip

Silicone strips designed for C-section (cesarean) and hysterectomy treatment sites. With Epi-Derm silicone gel strips for scars in the C-strip configuration, you can heal your surgical scars beautifully and enjoy your bikini again.

#### Epi-Derm Mastopexy

The Mastopexy form is a silicone patch for scars that is ideally suited for breast reduction (mammoplasty) and breast reconstruction surgery, and can be cut to size. Pairs of mastopexy forms and pairs of areola circles are sold separately.

#### Epi-Derm Areopexy

The areopexy form was designed for use following the Lejour Augmentation Technique. Unlike standard silicone gel sheets for scars, the Epi-derm areopexy form is specialized to accommodate the incisions used with Lejour breast augmentation and is a silicone patch for scars in an ideal "lollipop" configuration. The areopexy forms are sold in pairs and can be cut to size.

#### Epi-Derm Areola Circles

The areola circles are ideally dimensioned silicone gel sheets for small hypertrophic and keloid scars resulting from areola reconstruction and breast augmentation surgery. The areola circles can be cut to size and complement the pairs of mastopexy forms, which are sold separately.

#### Epi-Derm Standard Sheet

Silicone gel sheeting designed for managing mid-sized hypertrophic and keloid scars.

#### Epi-Derm Silicone Strip

Silicone scar strips in the most comfortable size and shape for C-section, tummy tuck, hysterectomy and cardiac procedures. Epi-Derm Standard Silicone Gel Sheet Silicone gel sheeting designed for managing mid-sized hypertrophic and keloid scars.

#### Epi-Derm Silicone Gel Sheeting Camo - Green & Pink

Small fabric backed silicone strips are ideal for managing any small scars including trauma, burns, mole removal, and much more. Epi-Derm® CAMO is the latest innovation in Biodermis' pediatric line of scar care products. Proven Epi-Derm silicone scar sheeting combined with a camouflage printed, soft fabric liner that provides industry leading scar care that kids WANT to wear! Comes in Pink and Green.
